## ■ Summary

# National Drought Mitigation Center

***Founded:*** 1995 at the University of Nebraska-Lincoln

***Mission:*** To lessen societal vulnerability to drought by promoting planning and the adoption of appropriate risk management techniques.

# NDMC Program Objectives

- ***Improve the science*** of drought monitoring, planning, and mitigation
- Build ***awareness*** of drought and its ***impacts*** on society and the environment, and how human actions affect our vulnerability to drought
- Focus the attention of policy makers on the importance of ***drought policy and planning*** in the wise stewardship of natural resources

**RESEARCH, OUTREACH, AND TRAINING**

# NDMC Organizational Overview

**Staff backgrounds:**

Climatology  
Meteorology  
Hydrology  
Water Resources

**Staff backgrounds:**

Planning  
Economics  
Public Participation  
Rural Sociology  
Anthropology  
Journalism

**Staff backgrounds:**

GIS  
Remote Sensing  
Geography  
Ecology

**23 diverse faculty & staff**  
**4 graduate students**  
**3 visiting international scientists**

# NDMC National Collaborations

## Federal

- **National Integrated Drought Information System (NIDIS)**
  - NIDIS Program Implementation Team, NIDIS Pilots Teams, NIDIS Portal Team, NIDIS Working Groups
- **NOAA:** RISAs, RCCs, NCDC, NWS Offices (D.C., Regional, RFCs, WFOs), CPC, ESRL/PSD etc...
- **NASA:** NASA Goddard Space Flight Center (GSFC) and Jet Propulsion Laboratory (JPL)
- **USDA:** NRCS National Water and Climate Center, RMA, ARS, Joint Agricultural Weather Facility, World Agricultural Outlook Board
- **USGS** Center for Earth Resources Observation Science (EROS)
- **U.S. Army Corps of Engineers:** Institute for Water Research
- **Bureau of Reclamation:** Lower Colorado Region

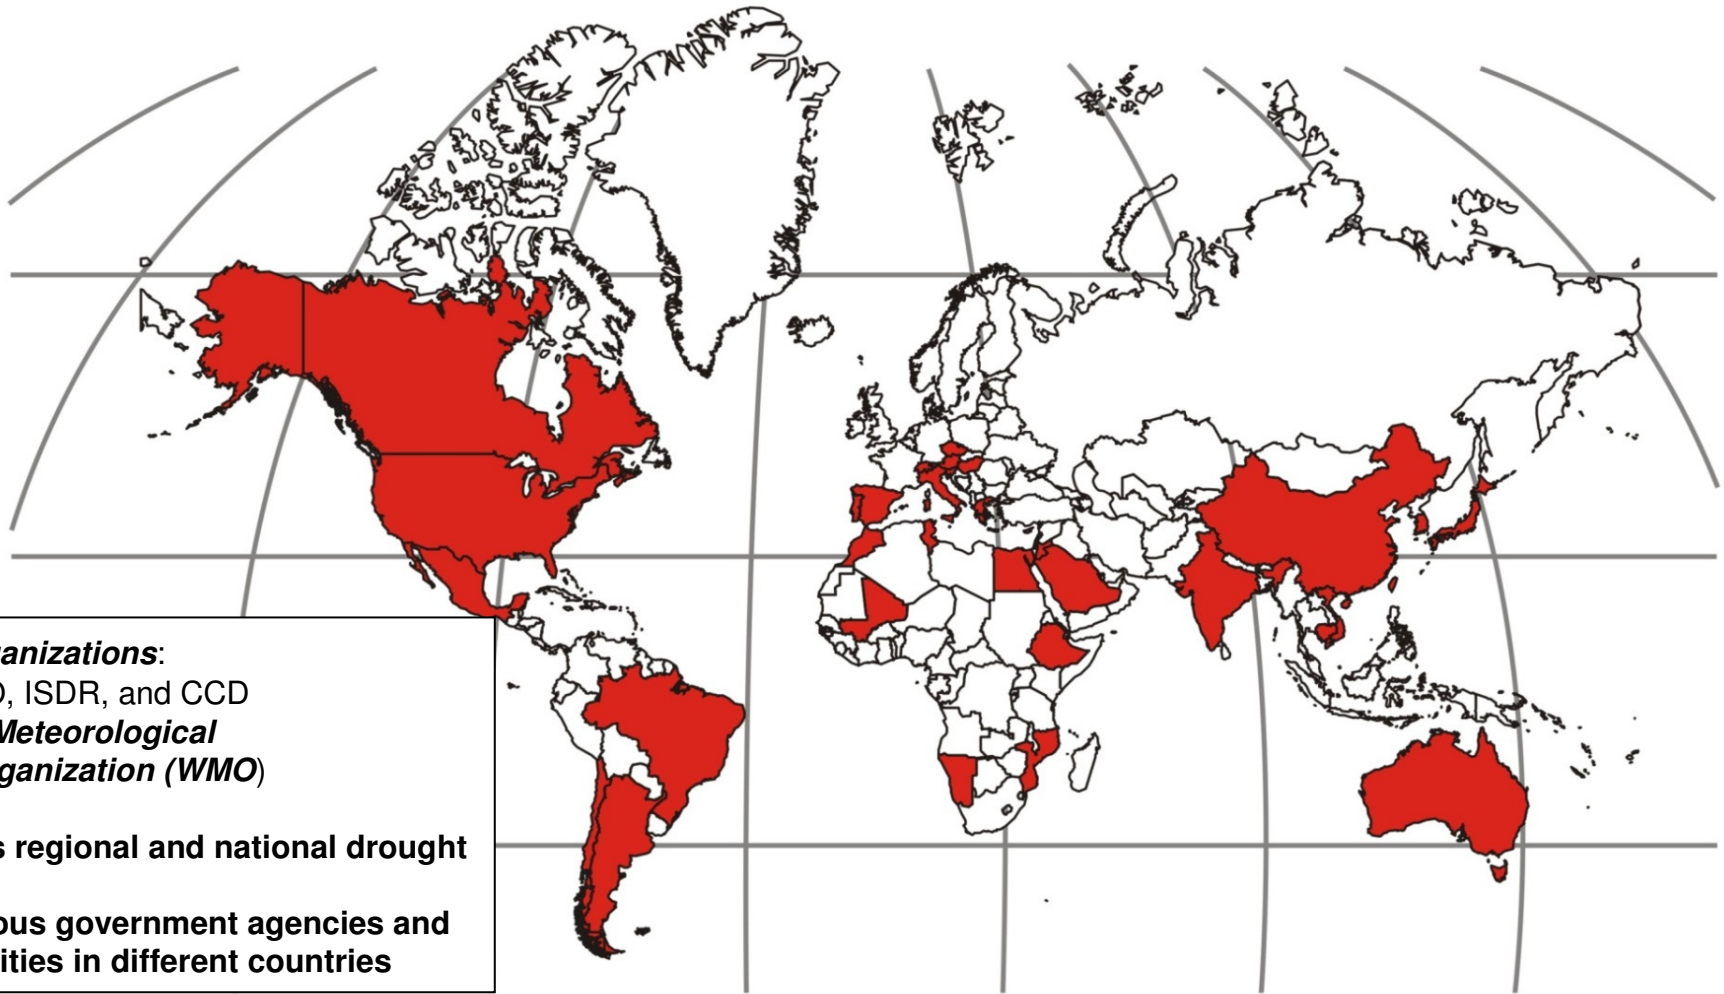

## National

- U.S. Drought Monitor Author Group and Listserv
- North American Drought Monitor Author Group and Listserv
- National Phenology Network
- National Conference of State Legislatures

## Other

- **Researchers at Universities:** Colorado, Arizona, Iowa State, Missouri, Kansas, Indiana, Purdue, Texas A&M, South Dakota State, Illinois, Oklahoma, New Mexico, UNK, Augustana, Colorado State, UMKC, South Carolina, Washington, Wisconsin, Dartmouth, California-Riverside, Scripps Research Institute, Center for Research on the Changing Earth System
- **States/Tribes:** Hualapai, Hawaii, Colorado, Missouri, Nebraska, Arizona, Illinois, Oklahoma
- **Communities:** Lincoln, NE; Kansas City, MO; Johnson County, KS; Nebraska City, NE; Decatur, IL; Ada, Cordell, Norman, OK
- **Nebraska Natural Resources Districts**

# NDMC International Activities

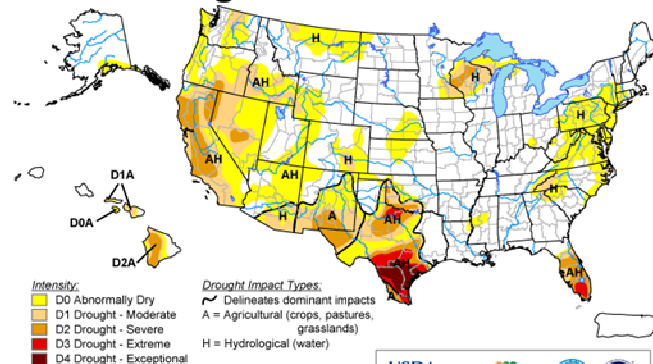

- **UN organizations:**  
FAO, ISDR, and CCD
- **World Meteorological Organization (WMO)**
- **US AID**
- **Various regional and national drought centers**
- **Numerous government agencies and universities in different countries**

## ■ Summary

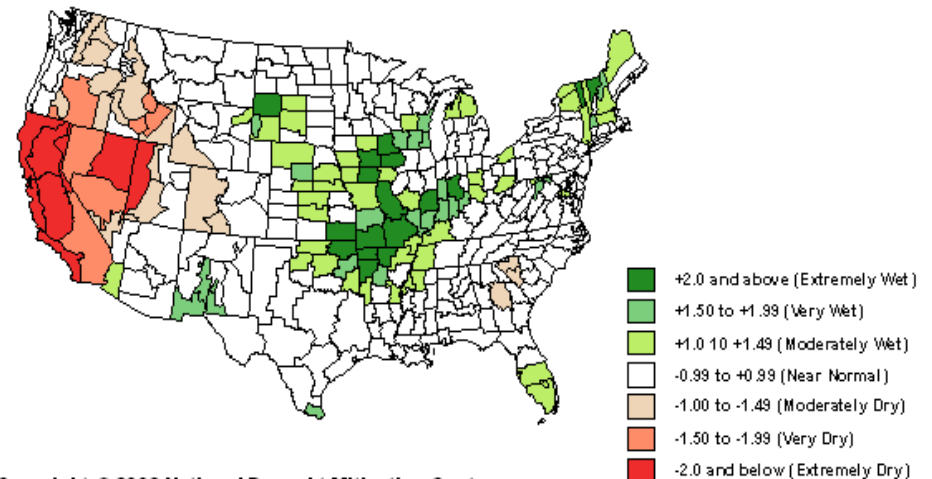

# Approaches to Drought Assessment

- Single index or indicator (parameter)
- Multiple indices or indicators
- ***Composite Indicator***

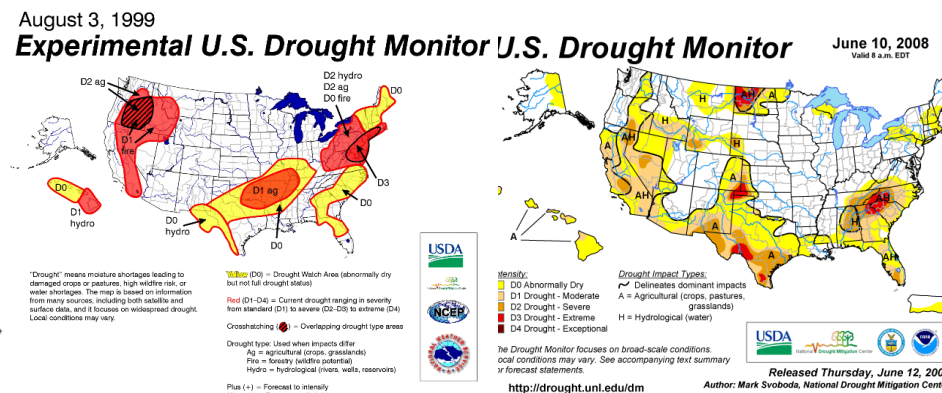

6-month SPI through the end of August 2008

# The U.S. Drought Monitor

*Since 1999, **NOAA (CPC, NCDC, WRCC)**, **USDA**, and the **NDMC** have produced a weekly composite drought map with input from numerous federal and non-federal agencies*

- **Western Region Climate Center** on board 2008
  - CalDry listserver hosted by CA DWR
- **10** authors in all
- **Incorporate** relevant information and products from all entities (and levels of government) dealing with drought (RCC's, SC's, federal/state agencies, etc.) (**~260 experts**)

UNIVERSITY OF  
**Nebraska**  
Lincoln

# Objectives

- “Fujita-like” scale
- Assessment of **current** conditions
- **NOT** a forecast!
- **NOT** a drought declaration!
- Identify **impacts** (A, H)
- Incorporate **local expert** input
- Be as **objective** as possible

# The Drought Monitor Concept

- A **consolidation of indices and indicators** into one comprehensive national drought map
- **“Convergence of evidence”** approach
- Trying to capture these characteristics:
  - the drought’s **magnitude** (duration + intensity)
  - spatial extent
  - probability of occurrence
  - ***Impacts***
- Rates drought intensity by ***percentile ranks***

# ***U.S. Drought Monitor Map***

## ***Drought Intensity Categories***

D0 **Abnormally Dry (30%tile)**

D1 Drought – **Moderate (20%tile)**

D2 Drought – **Severe (10%tile)**

D3 Drought – **Extreme (5%tile)**

D4 Drought – **Exceptional (2%tile)**

# Key Variables for Monitoring Drought

- *climate data*
- *soil moisture*
- stream flow
- ground water
- reservoir and lake levels
- snow pack
- short, medium, and long range forecasts
- *vegetation health/stress* and fire danger
- *impacts*

# U.S. Drought Monitor

## Integrates Key Drought Indicators:

- **Palmer Drought Index**
- **SPI**
- **KBDI**
- **Modeled Soil Moisture**
- **7-Day Avg. Streamflow**
- **Precipitation Anomalies**

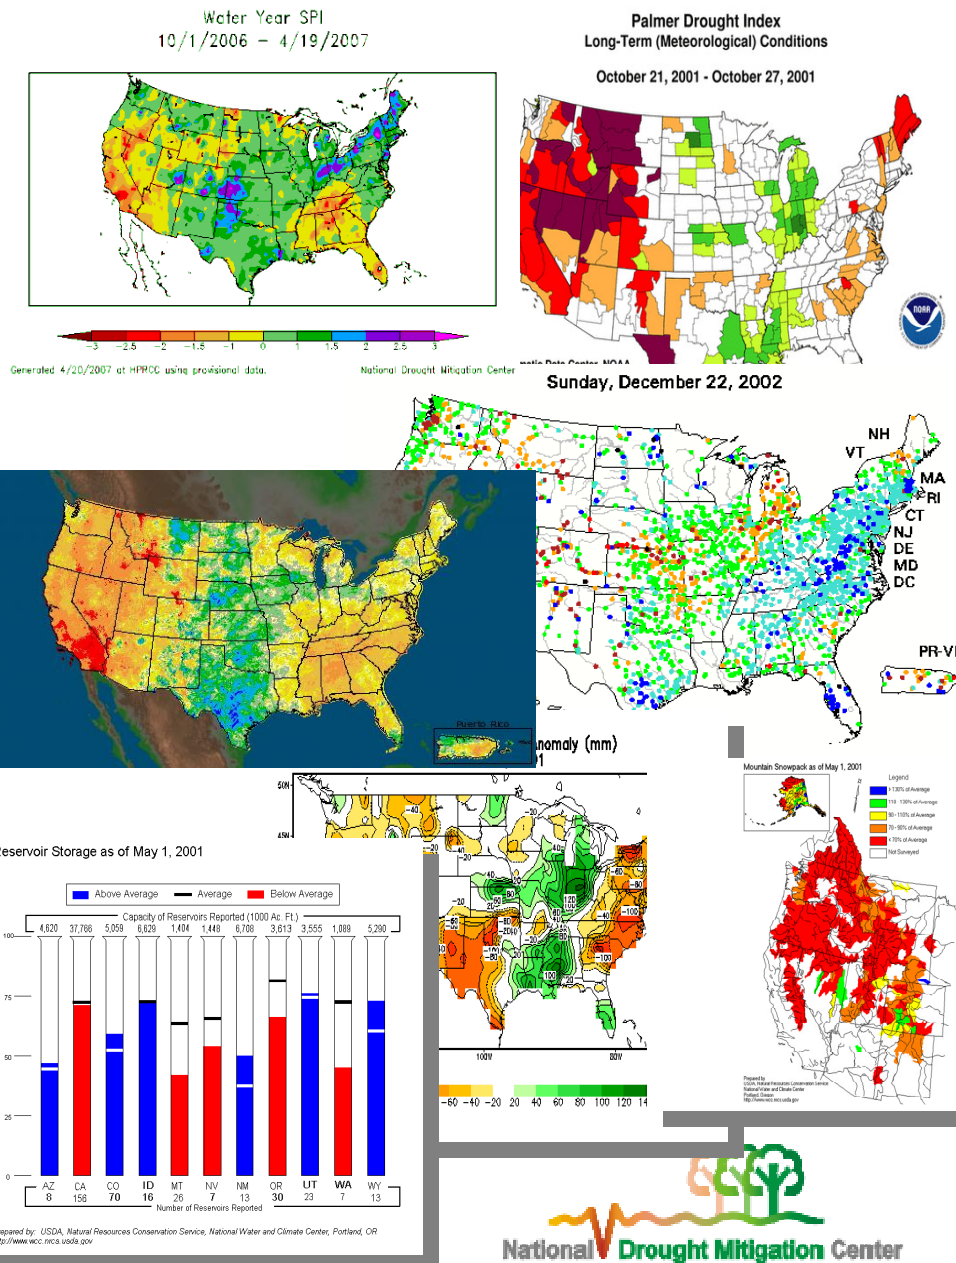

## Growing Season:

- **Crop Moisture Index**
- **Sat. Veg. Health Index**
- **Soil Moisture**
- **Mesonet data**

## In The West:

- **SWSI**
- **Reservoir levels**
- **Snowpack (SNOTEL)**
- **SWE**
- **Streamflow**

Created in ArcGIS

## Agricultural Weather Highlights – Friday - May 28, 2010

- *In the West*, cool weather and scattered showers continue to hamper crop development—especially in California, the Great Basin, and the Northwest.
- *On the Plains*, showers and thunderstorms are returning to northern areas, where a phenomenal 85% of the U.S. spring wheat crop was rated in good to excellent condition, according to USDA/NASS, on May 23. Meanwhile on the central and southern Plains, warm, dry weather is conducive to fieldwork activities, summer crop emergence and development, and winter wheat maturation.
- *In the Corn Belt*, scattered showers are mostly confined to the Ohio Valley. Elsewhere in the Midwest combination of warm, mostly dry weather and abundant soil moisture remains favorable for planting activities and corn and soybean emergence and growth.
- *In the South*, warm weather and isolated showers are maintaining generally favorable conditions for pastures, maturing winter grains, and recently emerged summer crops. Developing drought remains a concern, however, from eastern Texas into the lower Mississippi Valley.

**Outlook:** During the next few days, scattered showers and thunderstorms will affect the Southeast. Meanwhile, a cold front emerging from the West will cross the Plains on Saturday and the Midwest on Sunday. The front will reach the East Coast next Tuesday, June 1. During the next 5 days, the Southwest will remain dry, while precipitation could total as much as 1 to 3 inches across the northern Plains and the Southwest. During the weekend, temperatures will rebound to near-normal levels in the West. The NWS 6- to 10-day outlook for June 2-6 calls for below-normal temperatures in the Pacific Northwest and across the eastern one-third of the U.S., while warmer-than-normal weather will prevail from the nation's southwestern quadrant to the northern Plains. Meanwhile, above-normal precipitation in the Northwest and across the eastern one-third of the nation will contrast with drier-than-normal conditions in parts of the north-central U.S.

## WEEKLY WEATHER AND CROP BULLETIN

U.S. DEPARTMENT OF COMMERCE National Oceanic and Atmospheric Administration National Weather Service

U.S. DEPARTMENT OF AGRICULTURE National Agricultural Statistics Service and World Agricultural Outlook Board

## HIGHLIGHTS

May 16 - 22, 2010  
Highlights provided by USDA/WAOB

Weather covered the central Plains and the southern and eastern Corn Belt, maintaining a slow pace of fieldwork and hampering the emergence of recently planted crops such as corn and soybeans. In contrast, warm, dry weather prevailed for much of the week across the upper Midwest, allowing soybean and late-season corn planting to proceed. Meanwhile on the northern Plains, late-week rainfall aided winter wheat and spring-planted small grains. Significant rain also drenched the Southeast, slowing fieldwork but easing concerns about

## Nebraska Weather and Crops

Issue NE-CW2110

Released May 24, 2010

**Agricultural Summary:** For the week ending May 23, 2010, crop development and progress of field work were once again slowed by cool and wet conditions across the state, according to USDA's National Agricultural Statistics Service, Nebraska Field Office. Less than 4 days of field work were possible limiting soybean and sorghum planting. Crop emergence was now behind last year. Producers expressed concern over earlier planted corn's yellow color. Sugarbeets were replanted in some areas. Precipitation fell across most of the state with muddy feedlot conditions present in southern counties. High winds later in the week limited spraying of herbicides. Cattle were moved to spring pastures and the growth of grass was helped by the precipitation.

**Weather Summary:** Temperatures for the week averaged 1 degree below normal. Cool temperatures at the beginning of the week gave way to warmer conditions by week's end. Most areas of the state received precipitation with the South Central District receiving over 1.5 inches. However, accumulations were light in the Northeast District which has had only two-thirds of normal rainfall since April 1. High winds were recorded on numerous days.

Soil Moisture and Days Suitable: Nebraska, Week Ending May 23, 2010				
	This Week	Last Week	Last Year	Average
Topsoil				
Very Short	0	0	2	6
Short	3	2	27	20
Adequate	87	90	65	67
Surplus	10	8	7	6
Subsoil				
Very Short	0	0	3	9
Short	3	3	15	21

Wheat conditions rated 2 percent poor, 23 fair, 66 good, and 9 excellent, above the 10 percent good or excellent of last year and the 54 average. Wheat jointed was at 78 percent, nine days behind last year's 98 and eight days behind 96 average. Wheat headed was 6 percent complete, well behind last year's 26 and 31 average.

Oats conditions rated 9 percent fair, 51 good, and 10 excellent. Oats emerged was 98 percent, behind last year's 100 but equal to the average.

Dry beans planted were 6 percent complete, behind last year's 18 and 11 average.

Alfalfa rated 2 percent poor, 10 fair, 76 good, and 12 excellent. Conditions were above last year's 77 percent good or excellent condition and 63 average. First cutting of alfalfa was 12 percent complete.

Wild Hay conditions rated 9 percent fair, 80 good, and 11 excellent.

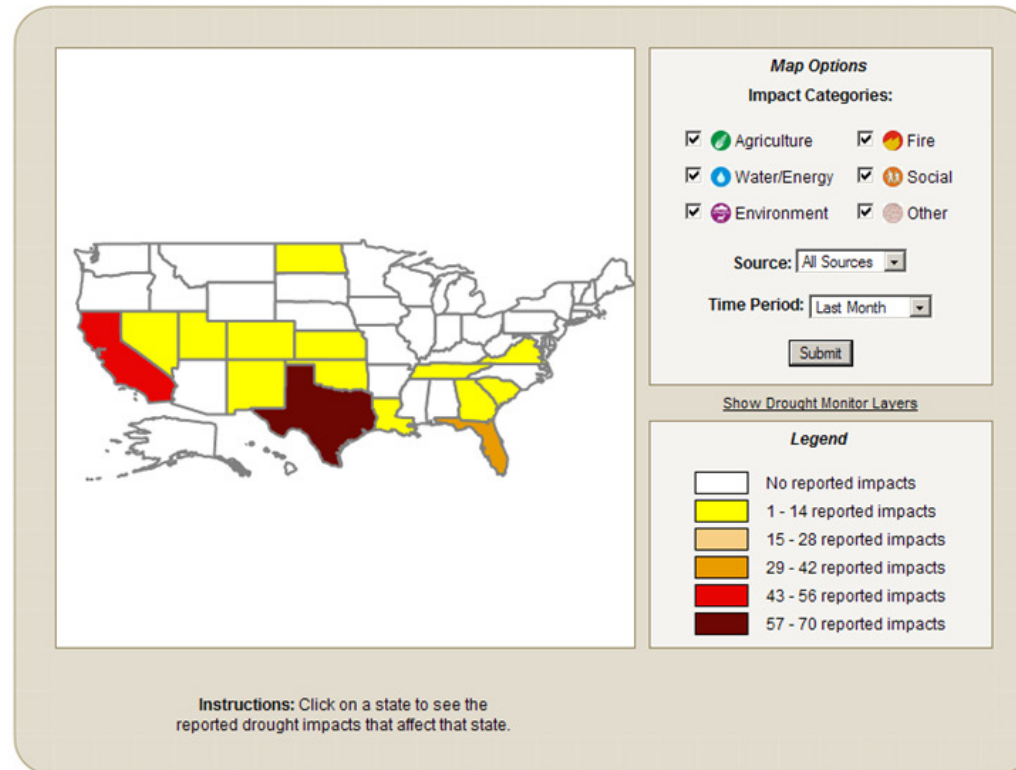

Crop Progress: Nebraska, Week Ending May 23, 2010				
Crop	This Week	Last Week	Last Year	Average
Alfalfa 1 <sup>st</sup> Cutting	12	5	18	17
Corn Planted	96	89	97	96
Corn Emerged	59	36	73	68
Dry Beans Planted	6	2	18	11
Oats Emerged	98	91	100	98
Soybeans Planted	63	44	84	70
Soybeans Emerged	15	6	36	24
Sorghum Planted	21	17	48	43
Sorghum Emerged	5	2	11	9
Wheat Jointed	78	60	98	96

Regions in northern Canada may not be as accurate as other regions due to limited information.

# Some closing DM thoughts:

- An explosion of good work and data/tools/models/products/research out there over the past 5 years (DM keeps evolving)
- Some very nice state efforts out there as well
- Moving more into a DSS/GIS/PDA/and mobile realm (user-defined)
- A model for others to follow?
- What resolution are you comfortable with?
  - The plea is obvious: “***No county left behind!***”
- Progress yes; Perfect, no....we'll keep improving the product as more new tools come on-line

## ■ Summary

# Standardized Precipitation Index (SPI)

**Overview:** The SPI is an index based on the probability of precipitation for any time scale.

**Who uses it:** Many drought planners/decision makers appreciate the SPI's temporal versatility.

**Pros:** Simple to compute/Only need precipitation /Flexible: can be computed for multiple time scales, can provide early warning of drought and help assess drought severity, and is less complex (less data needed as well) than the Palmer. Spatially consistent; Probabilistic for historical context and decision making.

**Cons:** Precipitation-based only; no soil component; thus no ET/PET calculated.

**Developed by:** T.B. McKee, N.J. Doesken, and J. Kleist, 1993

**Monthly maps:** <http://drought.unl.edu/monitor/spi.htm>

**Daily maps:**

[http://www.hprcc.unl.edu/maps/current/index.php?action=update\\_product&product=SPIData](http://www.hprcc.unl.edu/maps/current/index.php?action=update_product&product=SPIData)

# SPI

- The SPI was designed to quantify the precipitation deficit for **multiple time scales**. These time scales reflect the impact of drought on the availability of the different water resources. (Meteorological and soil moisture conditions (agriculture) respond to precipitation anomalies on a relatively short scale. Groundwater, streamflow, and reservoir storage reflect the longer-term precipitation anomalies).
- Can be calculated from 1-month out to 72-months. Statistically, **1-24-months is the best practical range** of application (Guttman)

# SPI

- The SPI calculation for any location is based on the long-term precipitation record for a desired period
- The **longer the POR**, the better. 30 years is okay, 50-60 years is optimal (Guttman)
- This long-term record is **fitted to a probability distribution**, which is then **transformed into a normal distribution** so that the **mean SPI for the location and desired period is zero** (Edwards and McKee, 1997).

# SPI

- Because the SPI is normalized, **wetter and drier climates** can be represented in the same way, and wet periods can also be monitored using the SPI
- A **drought event occurs** any time the SPI is continuously negative and reaches an **intensity of -1.0 or less**. The event ends when the SPI becomes positive
- Each drought event, therefore, has a **duration** defined by its beginning and end, and an intensity for each month that the event continues
- The **positive sum of the SPI** for all the months within a drought event can be termed the drought's **“magnitude”**

# SPI

- Positive SPI values indicate greater than median precipitation, and negative values indicate less than median precipitation (in standard deviations)

## Standard Normal Distribution

# SPI

- Additionally, no matter the location or time scale, the SPI represents a cumulative probability in relation to the base period for which the gamma parameters were calculated

SPI	Cumulative Probability
-3.0	0.0014
-2.5	0.0062
-2.0	0.0228
-1.5	0.0668
-1.0	0.1587
-0.5	0.3085
0.0	0.5000
+0.5	0.6915
+1.0	0.8413
+1.5	0.9332
+2.0	0.9772
+2.5	0.9938
+3.0	0.9986

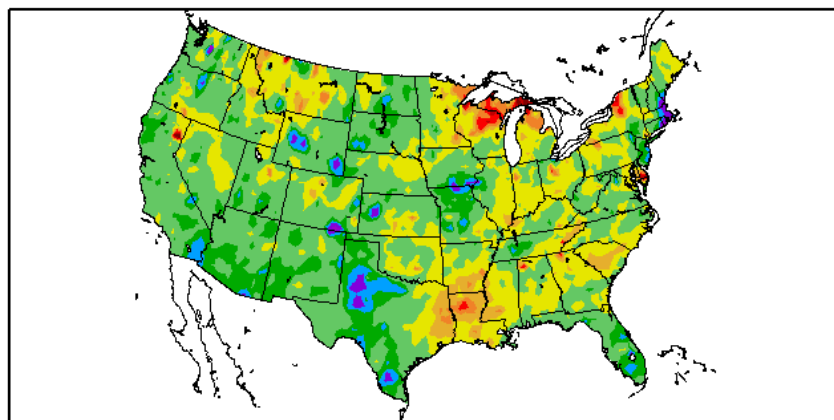

# SPI

- The SPI is normalized to a station location because it accounts for the frequency distribution of precipitation as well as the accompanying variation at the station (Edwards)
- The SPI is also normalized in time because it can be computed at any number of time scales, depending upon the impacts of interest to the analyst (Edwards)

Year-to-date SPI  
1/1/2010 - 5/24/2010

# SPI

Year-to-date SPI

- Flexible to a variety of needs

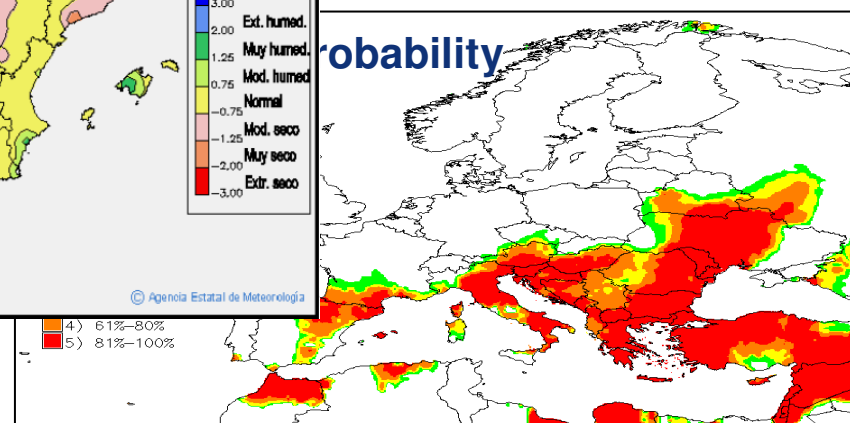

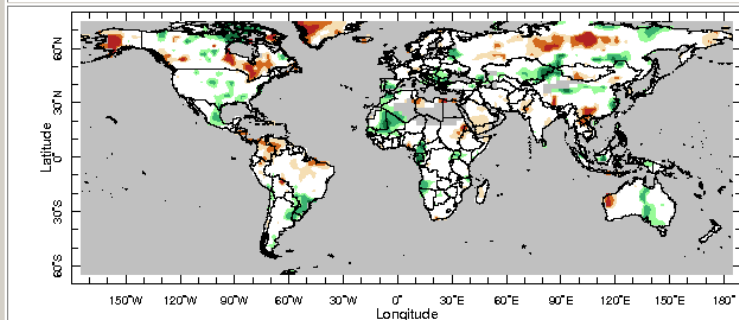

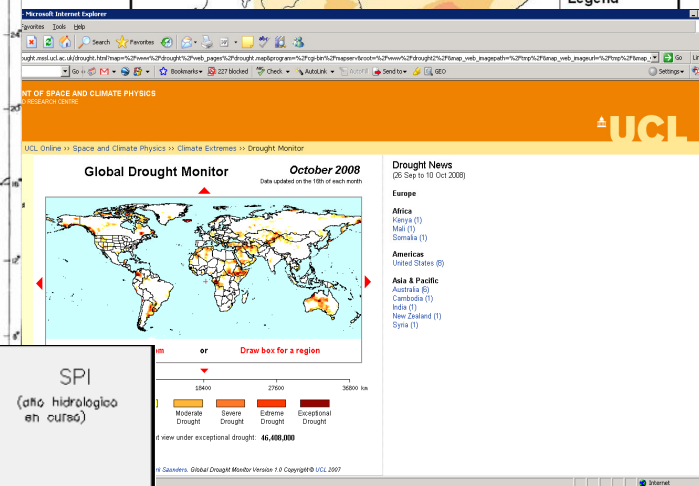

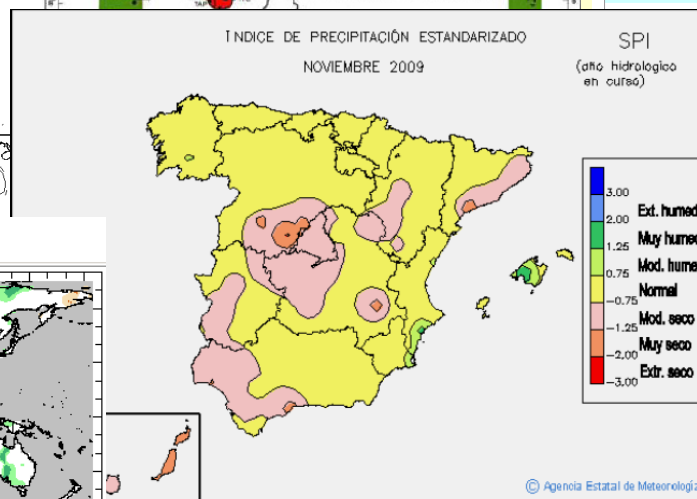

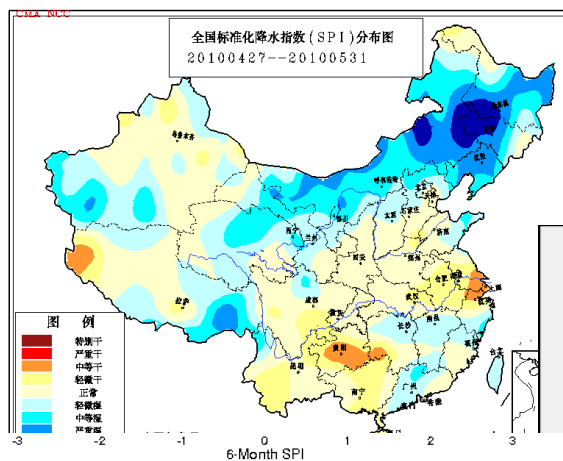

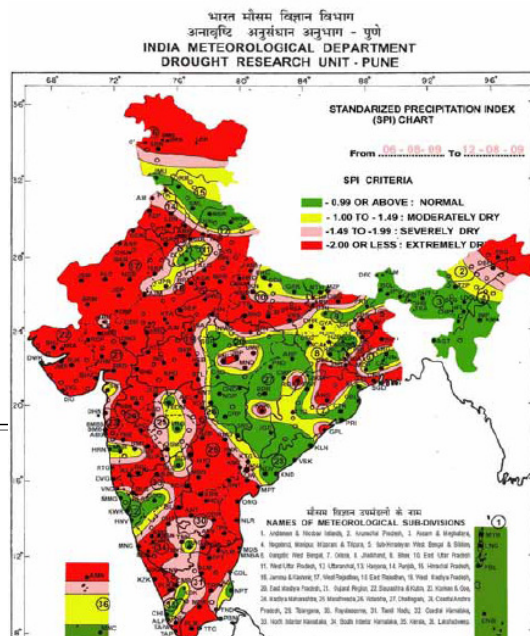

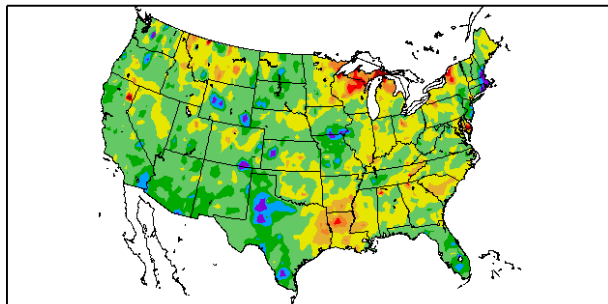

# SPI Applications

Standardised Precipitation Index for  
January 2008 to December 2008

Year-to-date SPI  
1/1/2010 - 5/24/2010

# What's New: The SPEI

- A new variation by **Vicente-Serrano** et al. (Spain)
- The Standardized Precipitation-Evapotranspiration Index (**SPEI**)
- **Inputs:** monthly precipitation and mean temperature ( and latitude of station site)
- Standardized monthly climatic balance computed from the difference between the cumulative precipitation and PET (Thornthwaite)
- Ability to depict changes due to **climate change** given the T and derived PET component vs. the regular SPI, which doesn't have T factored in

# Palmer Drought Severity Index (PDSI)

**Overview:** The Palmer (PDSI) is a soil moisture algorithm calibrated for relatively homogeneous regions.

**Who uses it:** Many U.S. government agencies and states rely (relied) on the Palmer to help trigger drought relief programs. This is changing.

**Inputs:** Precipitation, Temperature, AWHC if available

**Pros:** The first **comprehensive drought index** developed in the United States. **Full derivative suite** includes the Palmer (Z) and Palmer Hydrological Index (PHDI). **Water balance approach.**

**Cons:** Palmer values **may lag emerging droughts** by several months; **less well suited for arid or mountainous** land or areas of frequent climatic extremes; **complex**—has an unspecified, built-in **fixed time scale**; **doesn't take snow** into account. **Not spatially consistent, difficult to understand.**

**Developed by:** W.C. Palmer, 1965.

**Weekly maps:** [http://www.cpc.ncep.noaa.gov/products/analysis\\_monitoring/regional\\_monitoring/palmer.gif](http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/regional_monitoring/palmer.gif)

**Monthly maps:**

<http://vlb.ncdc.noaa.gov/oa/climate/research/prelim/drought/palmer.html>

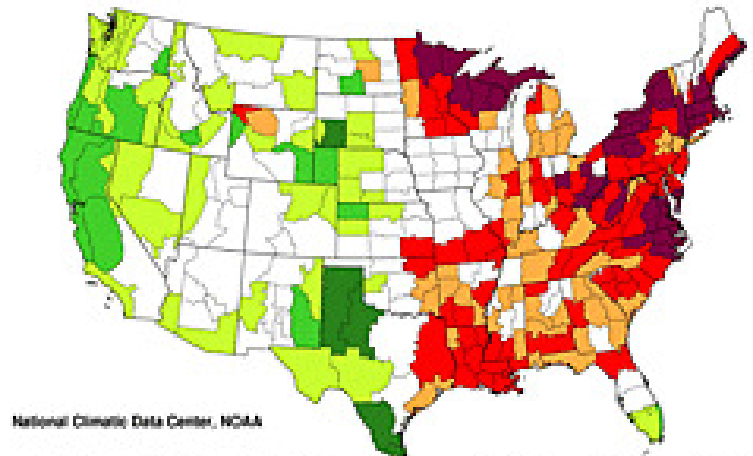

# PDSI

- Palmer **based** his index on the supply-and-demand concept of the **water balance equation**, taking into account more than just the precipitation deficit at specific locations
- The objective of the Palmer Drought Severity Index (PDSI), as this index is now called, was to provide measurements of moisture conditions that were standardized so that comparisons using the index could be made between locations and between months (Palmer 1965)
- The PDSI is a meteorological drought index, and it responds to weather conditions that have been abnormally dry or abnormally wet.
- The PDSI is calculated **based on precipitation and temperature data, as well as the local Available Water Content (AWC)** of the soil. From the inputs, all the basic terms of the water balance equation can be determined, including potential evapotranspiration (Thornthwaite), soil recharge, runoff, and moisture loss from the surface layer.

# Palmer Suite

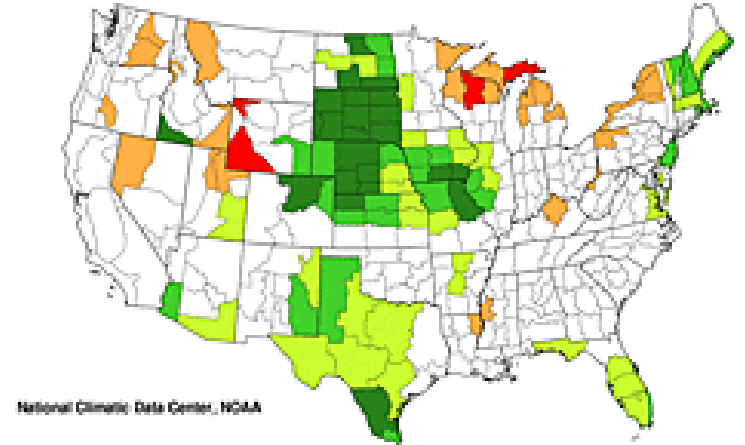

Palmer Z Index  
Short-Term Conditions

April 2010

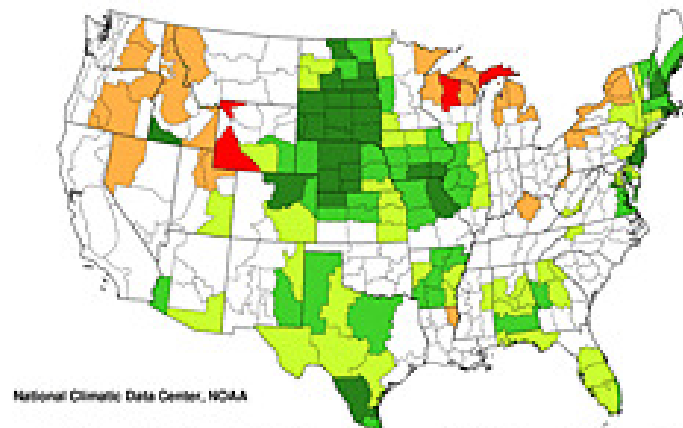

Palmer Drought Index  
Long-Term (Meteorological) Conditions

April 2010

Palmer Hydrological Drought Index  
Long-Term (Hydrological) Conditions

April 2010

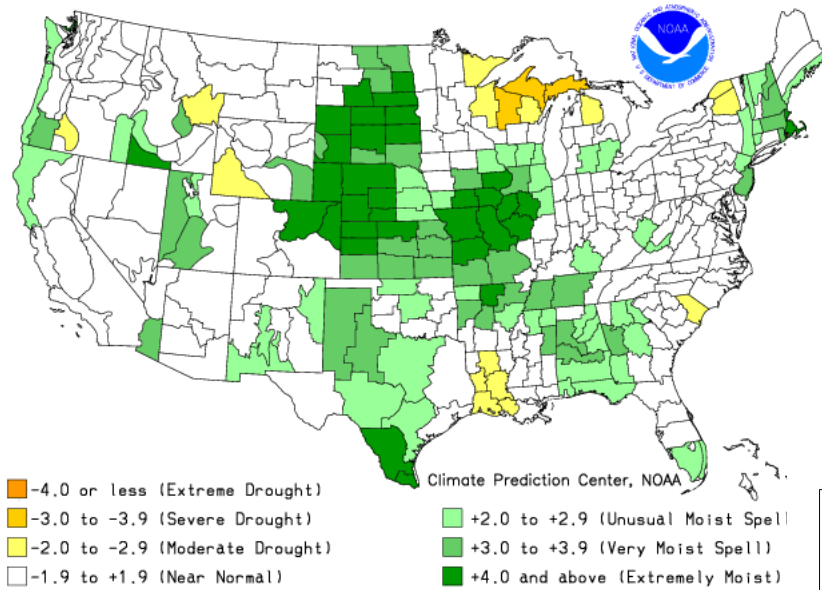

# Modified PDSI

- In 1989, a **modified** method to compute the PDSI was begun operationally (Heddinghaus and Sabol, 1991). This modified PDSI differs from the PDSI during transition periods between dry and wet spells (quicker switch)
- Calculated **weekly** by NOAA's-Climate Prediction Center:  
[http://www.cpc.ncep.noaa.gov/products/analysis\\_monitoring/regional\\_monitoring/palmer.gif](http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/regional_monitoring/palmer.gif)

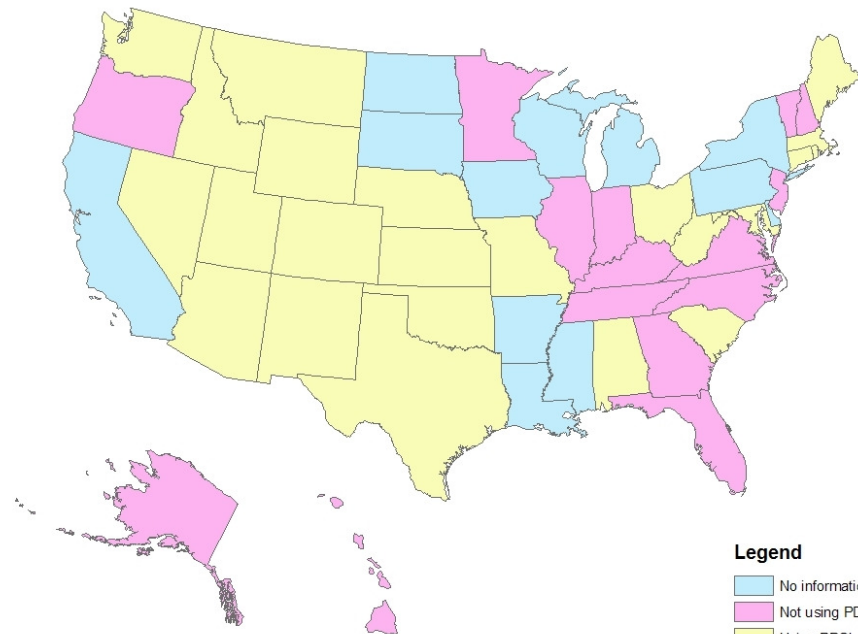

# Modified PDSI

Drought Severity Index by Division  
Weekly Value for Period Ending MAY 22, 2010  
Long Term Palmer

## PDSI

# Crop Moisture Index (CMI)

**Description:** A **Palmer derivative**, the CMI reflects moisture supply in the short term across major crop-producing regions and is not intended to assess long-term droughts. **Requires Mean weekly T and weekly total Precipitation.**

**Pros:** Identifies potential agricultural droughts; **quick response**

**Cons:** Because it is designed to monitor short-term moisture conditions affecting a developing crop, the CMI is **not a good long-term (multi-year) drought monitoring tool; resets to zero each year**

**Developed by:** W.C. Palmer, 1968

**Weekly maps:**

([http://www.cpc.ncep.noaa.gov/products/analysis\\_monitoring/regional\\_monitoring/cmi.gif](http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/regional_monitoring/cmi.gif))

# CMI continued

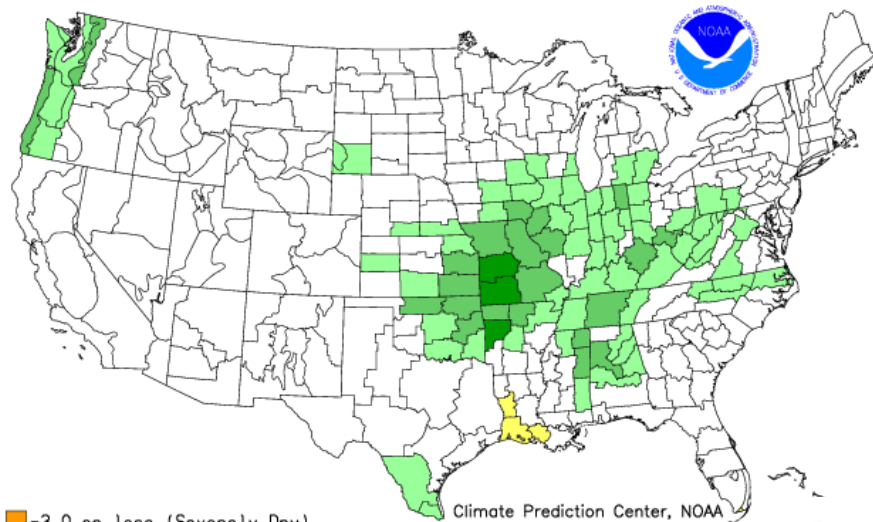

- The Crop Moisture Index (CMI) uses a **meteorological approach** to monitor week-to-week crop conditions
- It was developed by Palmer (1968) from procedures within the calculation of the PDSI. Whereas the PDSI monitors long-term meteorological wet and dry spells, the CMI was **designed to evaluate short-term moisture conditions** across major crop-producing regions
- It is **based on** the mean temperature and total precipitation for each week within a climate division, as well as the CMI value from the previous week

# CMI continued

- The CMI **responds rapidly** to changing conditions, and it is **weighted by location and time** so that maps, which commonly display the weekly CMI across the United States, can be used to compare moisture conditions at different locations
- Another characteristic of the CMI that limits its use as a long-term drought monitoring tool is that the **CMI typically begins and ends each growing season near zero**. This limitation prevents the CMI from being used to monitor moisture conditions outside the general growing season, especially in droughts that extend over several years

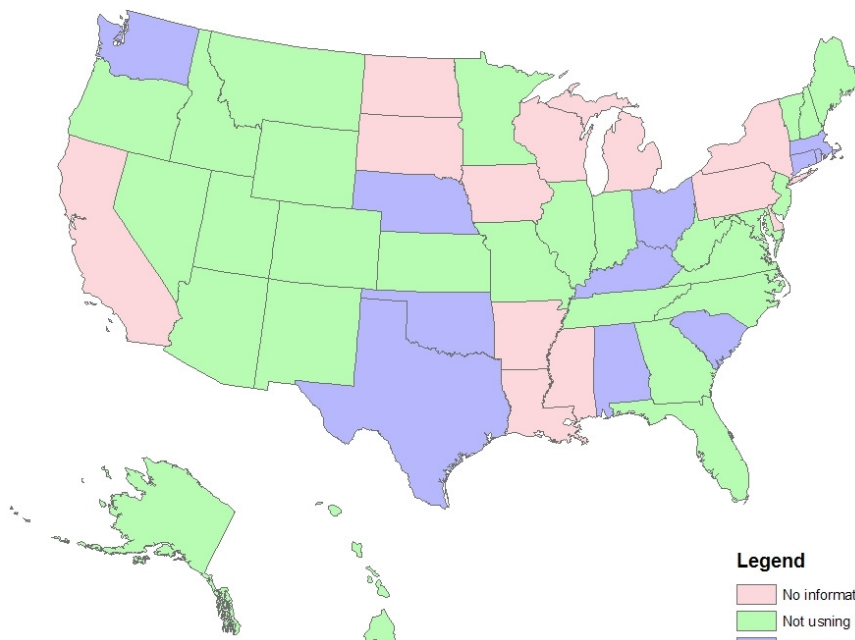

Crop Moisture Index by Division  
Weekly Value for Period Ending MAY 22, 2010  
Short Term Need vs. Available Water in a Shallow Soil Profile

- Climate Prediction Center, NOAA
- 3.0 or less (Severely Dry)
  - 2.0 to -2.9 (Excessively Dry)
  - 1.0 to -1.9 (Abnormally Dry)
  - 0.9 to +0.9 (Slightly Dry/Favorably Moist)
  - +1.0 to +1.9 (Abnormally)
  - +2.0 to +2.9 (Wet)
  - +3.0 and above (Excessive)

# Key Variables for Monitoring Drought

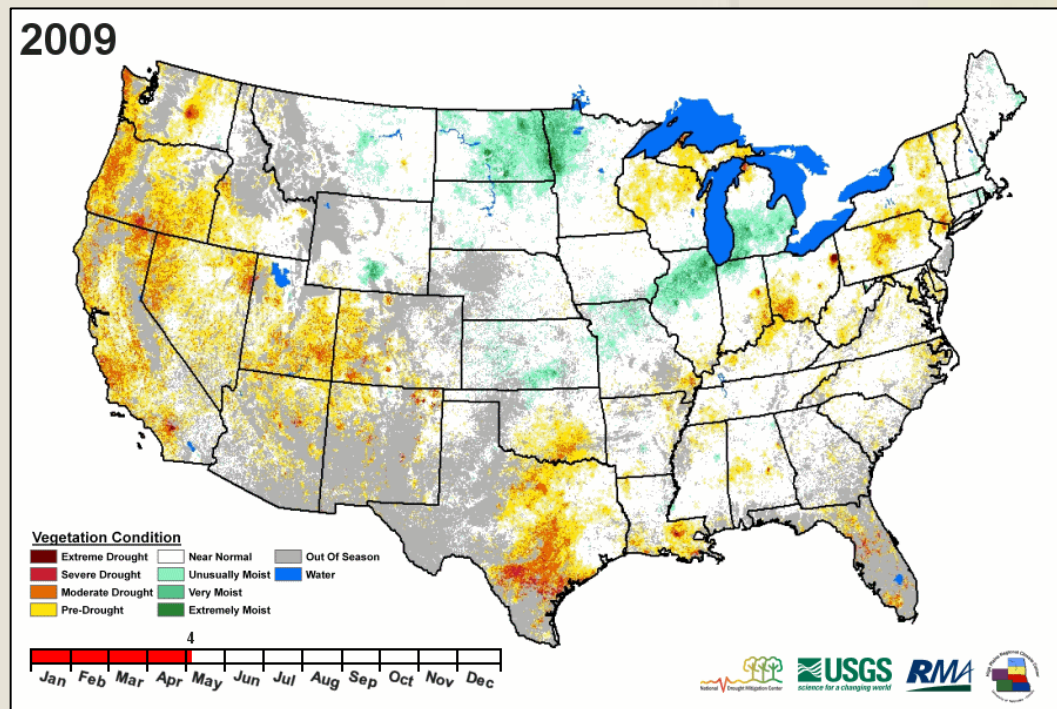

- **climate data**
- **soil moisture\***
- **stream flow**
- **ground water\***
- **reservoir and lake levels\***
- **snow pack\***
- **short, medium, and long range forecasts\***
- **vegetation health/stress and fire danger\***
- **sectoral impacts\***

***(\*) Opportunities for Enhancing  
Drought Monitoring & Early Warning Systems***

NASA (and others) observations/products can provide spatially detailed information to complement traditional *in situ* measurements.

# Initial Remote Sensing Efforts to Support the USDM

1. **Vegetation Drought Response Index (VegDRI)** – integrates satellite-based vegetation index (VI) observations, climate-based drought index data, and general environmental information (e.g., LULC type, soils, and elevation).

[http://drought.unl.edu/vegtri/VegDRI\\_Main.htm](http://drought.unl.edu/vegtri/VegDRI_Main.htm)

Brown, J.F., **B.D. Wardlow**, T. Tadesse, M.J. Hayes, and B.C. Reed, 2008. The vegetation drought response index (VegDRI): a new integrated approach for monitoring drought stress in vegetation. *GIScience and Remote Sensing*, 45(1):16-46.

- NDMC and USGS Center for EROS are working to develop a MODIS-based VegDRI to replace the current AVHRR VI-based operational VegDRI products.

**“National Drought Monitoring System for Drought Early Warning Using Hydrologic and Ecologic Observations from NASA Satellite Data”**

**Investigators:** S. V. Nghiem (JPL, PI), J. P. Verdin (USGS, Lead Co-I), D. A. Wilhite (NDMC), R. Dole (NOAA PSD), D. LeComte (NOAA CPC), G. R. Brakenridge (Dartmouth DFO), E. G. Njoku (JPL)

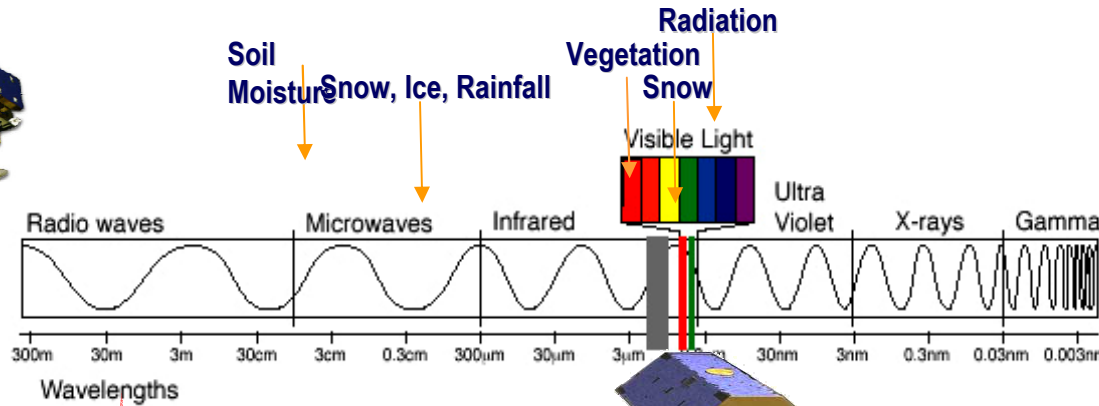

**Project supported by:** NNH07ZDA001N: NASA Decision Support through Earth Science Research Results

# Remote Sensing of the Water Cycle

**Aqua:**  
MODIS,  
AMSR-E,  
etc.

Traditional radiation-based remote sensing technologies cannot sense water below the first few centimeters of the snow-canopy-soil column

## GRACE

GRACE is unique in its ability to monitor water at all levels, down to the deepest aquifer

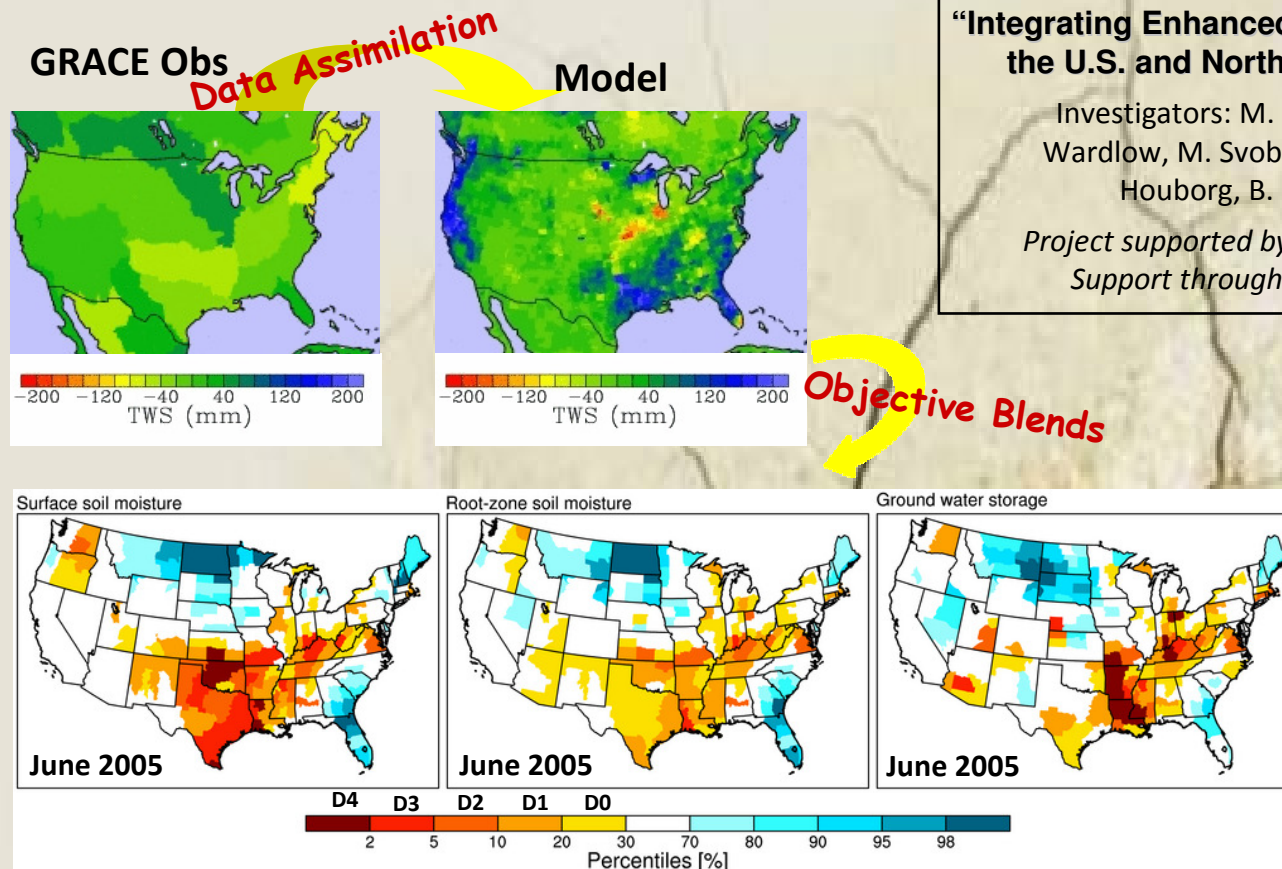

National Drought Mitigation Center  
Matt Rodell  
NASA GSFC

# Initial Remote Sensing Efforts to Support the USDM

2. **Terrestrial Water Storage (TWS)** calculated from GRACE data and the Land Data Assimilation System (LDAS). Several vertical TWS products ranging from surface soil moisture to ground water storage are being developed for the USDM.

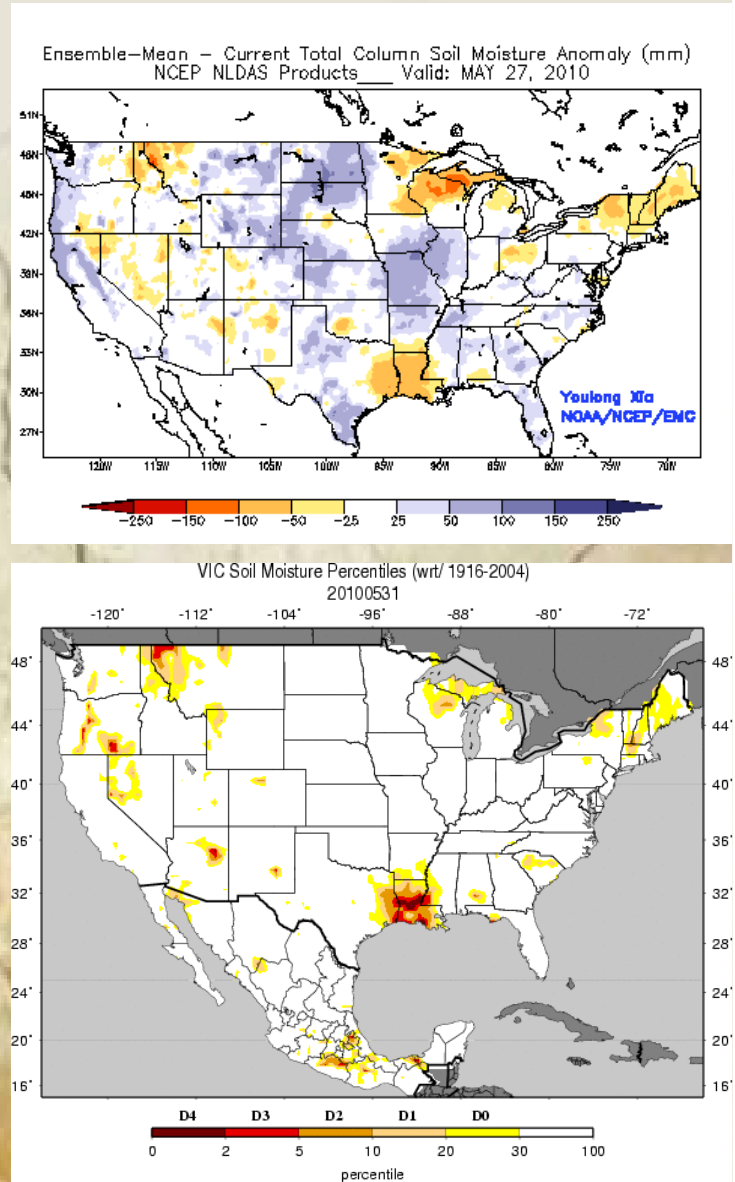

**“Integrating Enhanced GRACE Water Storage Data into the U.S. and North American Drought Monitors”**

Investigators: M. Rodell, J. Lawrimore, R. Heim, B. Wardlow, M. Svoboda, J.S. Famiglietti, R. Reichle, R. Houborg, B. Li, R. Tinker, M. Rosencrans

Project supported by: *NNH07ZDA001N: NASA Decision Support through Earth Science Research Results*

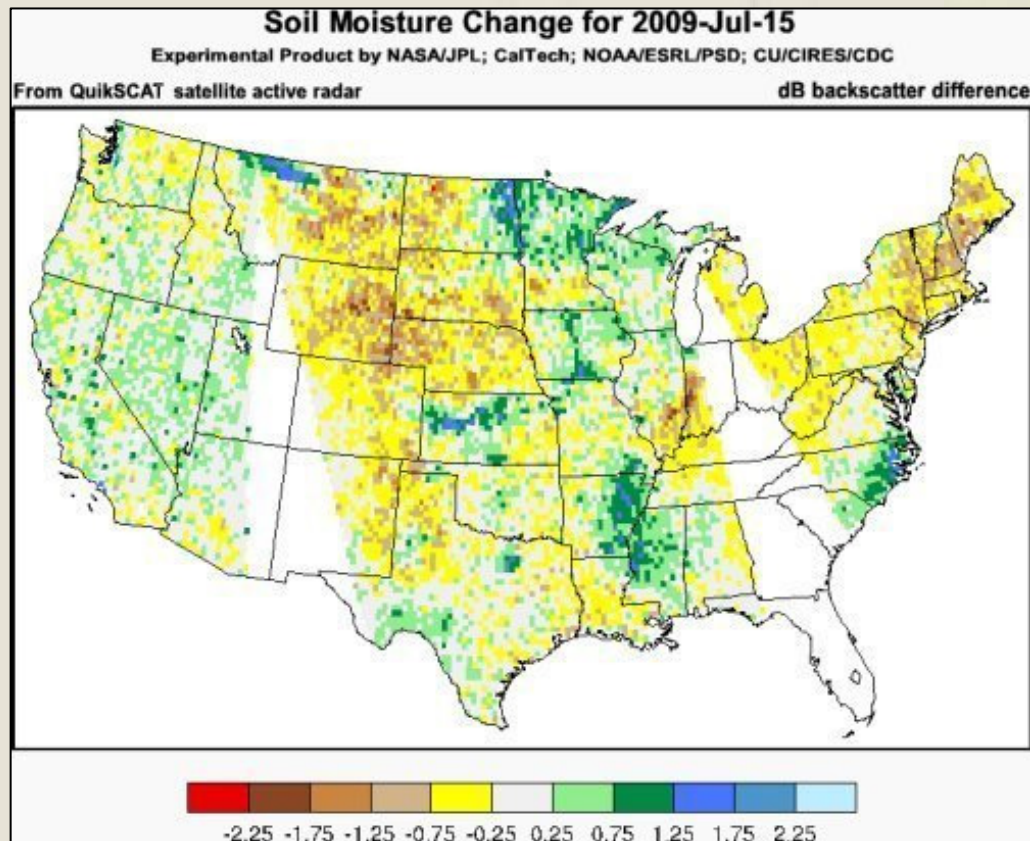

# What is the National Land Data Assimilation System (NLDAS)?

- The Land Data Assimilation System (LDAS) consists of uncoupled models forced with observations, satellite data and radar precipitation measurement, and is therefore not affected by Numerical WP forcing biases.
- Near real-time using existing Surface Vegetation Atmosphere Transfer Schemes (SVATS) by NCEP, NASA, Princeton University, and the University of Washington at 1/8 degree (about 14 kilometer) resolution across North America and at 1/4 degree resolution globally.
- Outputs: soil moisture, snow water equivalent, total runoff, streamflow, evaporation and precipitation.
- The SM anomalies and percentiles are based on a 28 year climatology (1980 - 2007)

# Initial Remote Sensing Efforts to Support the USDM

3. **Soil Moisture Change (SMC)** information calculated from QuikSCAT and AMSR-E data.

Work is ongoing with NASA JPL, NDMC, and the USDM authors to:

- 1) define specific SMC products,
- 2) evaluate the utility of the SMC data for drought applications, and
- 3) develop strategies to integrate the SMC information into the USDM process and NIDIS portal

**“National Drought Monitoring System for Drought Early Warning Using Hydrologic and Ecologic Observations from NASA Satellite Data”**

Project supported by: NNH07ZDA001N: NASA Decision Support through Earth Science Research Results

# Initial Remote Sensing Efforts to Support the USDM

4. **Evaporative Stress Index (ESI)** depicts 'moisture' stress from both the soil and vegetation canopy based on ET flux estimates from a land surface model (ALEXI & DisALEXI) that relies primarily on remotely sensed thermal observations.

## **“A GOES Thermal-based Drought Early Warning Index for NIDIS”**

**Investigators:** M.C. Anderson (USDA ARS), K.C. Mo (NCEP-CPC), M. Svoboda (NDMC), B. Wardlow (NDMC), X. Zhan (NESDIS), J.R. Mecikalski (U of Alabama), W.P. Kustas (USDA ARS), and J.F. Brown (USGS-EROS)

Project supported by: OAR-CPO-2009-2001430: NOAA Climate Dynamics and Experimental Prediction (CDEP) Competition – Drought Forecast Products and Applications

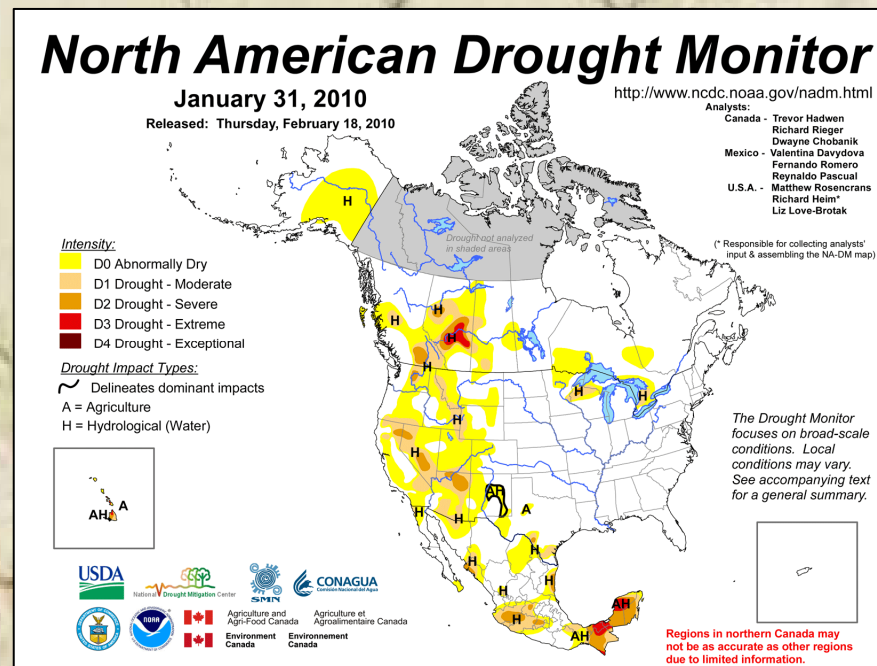

Anderson, M.C., Norman, J.M., Mecikalski, J.R., Otkin, J.A., Kustas, W.P. 2007. A climatological study of evapotranspiration and moisture stress across the continental U.S. based on thermal remote sensing. II. Surface moisture climatology. *Journal of Geophysical Research*. 112, D11112. <http://dx.doi.org/10.1029/2006JD007507>.

# USDM Concept Expanded to North America

The monthly North American Drought Monitor (NADM) was introduced in 2003 and built upon the USDM concept.

## **Challenges:**

1. Limited number of data inputs compared to the USDM
2. Data inconsistencies (e.g., specific measure, format, and quality) among countries
3. Currently, limited use of remote sensing-derived inputs (primarily NDVI).

## ■ Summary

# National Integrated Drought Information System (NIDIS)

A NOAA-led Federal, State, Tribal and Local Partnership

*(Public Law 109-430, 2006)*

**Goal of NIDIS:** Improve the nation's capacity to 'proactively' manage drought-related risks by **providing decision makers with the best available information and tools** to assess the impact of drought and to better prepare for and mitigate the effects of drought.

[www.drought.gov](http://www.drought.gov)

# NIDIS Implementation Team Partners (to date): →

[www.drought.gov](http://www.drought.gov)

## **Other Partners:**

Western Governors Association (WGA)

***National Drought Mitigation Center (NDMC)***

Regional Climate Centers

American Association of State Climatologists

Indigenous Waters Network

Weather Channel

Numerous Universities including:

University of Oklahoma, University of South Carolina, University of Washington, South Dakota State University, and Cornell University.

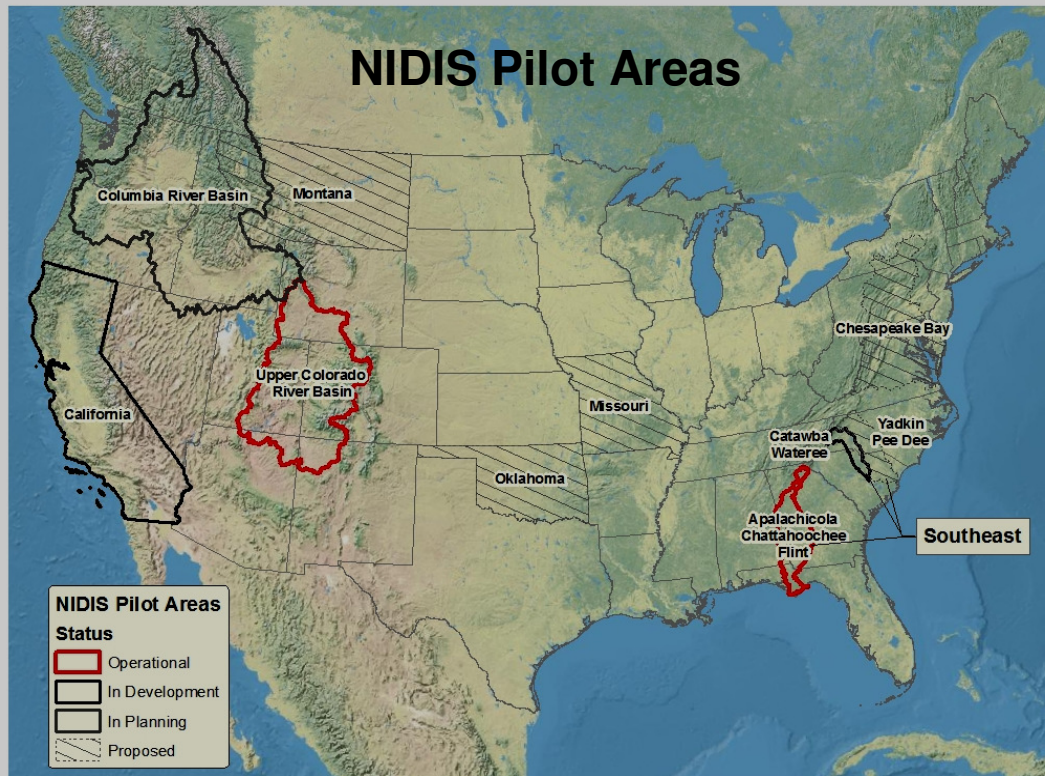

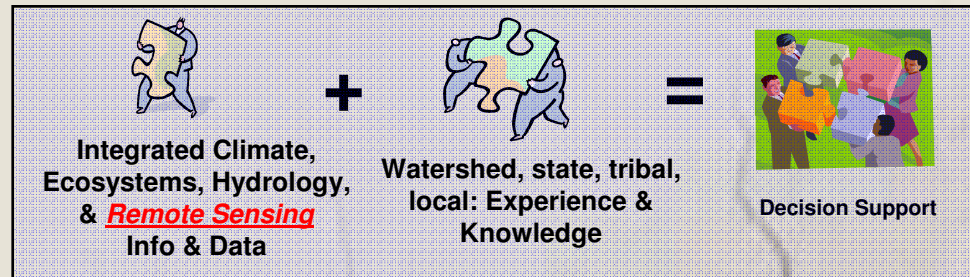

# **Roles of the NDMC in NIDIS**

- **Co-Chair of the NIDIS Executive Council**
  - Wilhite, Director of UNL-SNR
- **NIDIS Program Implementation Team (Hayes Co-Chair)**
  - Svoboda, Bathke, and Hayes
- **U.S. Drought Portal Co-Chair (Svoboda)**
- **Engaging Preparedness Communities Co-Chair (Bathke)**
- **NIDIS Portal Help Desk**
- **NIDIS Pilot Project Coordination Workshops**
- **NIDIS Regional Drought Monitor/EWS Projects (Svoboda, Wardlow and Fuchs)**

# NIDIS Pilots

## *A Geographic Framework for Developing Drought Early Warning Systems (EWS) for Local-Scale Decision Making*

- **Issue-based** EWS tailored to the critical decisions and issues facing each basin
- Each EWS will be unique with **specific inputs and methods** developed and implemented by local experts
- **Partnerships** between:
  - 1) federal, state, and local agencies,
  - 2) tribal groups,
  - 3) other types of NGOs; and
  - 4) private sector

# The Role of Remote Sensing

## *The Push for Drought Information to Support Local-Scale Decision Making*

“Create a drought “early warning system” capable of providing **accurate, timely, and integrated information on drought conditions** and associated risks **at relevant spatial scales** to facilitate proactive decisions.”

- Creating a Drought Early Warning System for the 21<sup>st</sup> Century, Western Governors' Association, 2007

Complementary **data from remote sensing, satellites, radar, aircraft** and other technologies **must be explored**, encouraged and incorporated **to fill important data gaps**.

NIDIS Workshop on Satellite Remote Sensing for Drought Monitoring – Boulder, CO February 6-7, 2008.

- NIDIS Implementation Plan, 2007

## National Integrated Drought Information System - NIDIS

*A Pathway for National Resilience*

Fall 2009

Volume 1 Issue 1

### Upper Colorado River Basin Pilot

The first NIDIS drought early warning and information system pilot was successfully launched during October 2008 with a meeting of stakeholders in Boulder, CO. In this newsletter, find these related articles...

#### Upper Colorado River Basin Scoping Workshop

1-2 October, 2008, NOAA David Skaggs Research Center, Boulder, CO.....2

#### Colorado State Climatologist is Key to the Success of the UCRB Pilot.....2

#### NCAR Scientists Working on Analysis of Water Demand in the Upper Colorado River Basin.....3

#### Monitoring Gaps Assessment Workshop

10 December, 2008, NOAA David Skaggs Research Center, Boulder, CO.....3

#### Drought Index Planning Workshop

18-19 August, 2009, NOAA David Skaggs Research Center, Boulder, CO.....3

### Welcome!

Welcome to the first edition of the NIDIS Newsletter. A lot has happened in the past year, and we want to update the drought risk management and water resources communities on NIDIS activities. In our newsletter you will find information about the various NIDIS meetings that have been held in the past year, along with the key outcomes from each meeting. We will also highlight early warning information system pilot and research activities.

#### Also in this issue...

Southeast United States Drought Early Warning Information System Planning Meeting  
21-22 July, 2009, University of North Carolina - Chapel Hill.....4

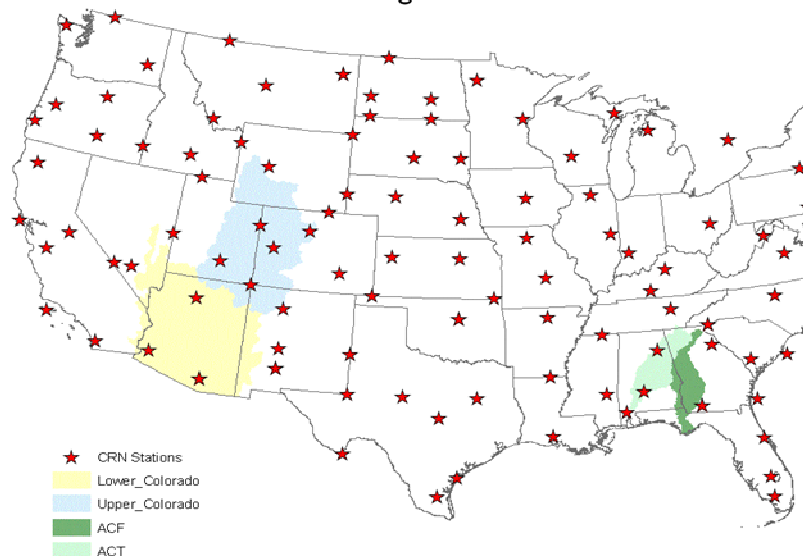

Climate Reference Network Soil Moisture Workshop  
3-5 March, 2009, NOAA/Air Resources Laboratory, Oak Ridge, TN.....5

## ■ Summary

# **Drought Monitoring State of the Science: Where are we now?**

- **Heightened awareness as a result of IPCC AR4**
- **A vast amount of good work, tools, products and lessons learned out there over the past several years**
- **Impediments remain**
  - **Lack of coordination**
  - **Lack of trigger ties to any drought plans**
  - **Resources**
  - **Lack of data/long-term data**
  - **Lack of institutional cooperation**
  - **Lack of drought “mitigation” plans**

# Drought Monitoring State of the Science: Where are we now?

- WCC-3, GDPN/GEOSS is a way to learn/leverage from one another
  - Canada/Mexico/United States
  - UN/WMO/others
- Many regions/countries are working together to better monitor drought
- Global monitoring of drought impacts is virtually non-existent
- Early warning/monitoring just one key: **THEN WHAT?** Need linkages to risk/vulnerability assessment and planning for adaptation
- Many indicators don't reflect reality in various regions, or for various season(s).....or for both!

# Future Drought Monitoring Challenges

## The Big Five:

- Impact collection/quantification
- Soil moisture (especially *in situ*)
- Hydrology (surface and groundwater)
- Application of Remotely Sensed/Modeled products operationally (trust)
- Ecological/Environmental (D-x E?)
  - ***“If a drought occurs in the desert, does anybody see it?”***
